

# Ecosystem approach - marine integrated management plans

Geir Klaveness, Specialist Director

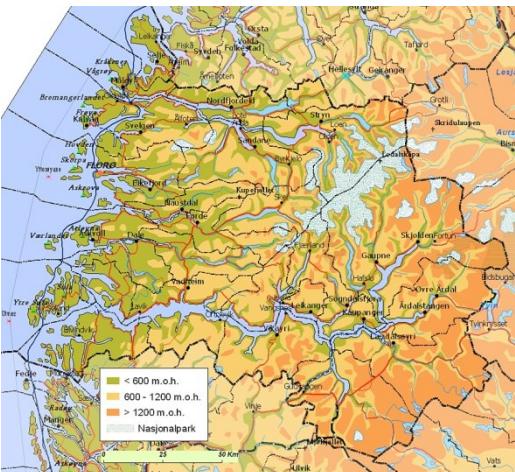

# Significance of marine ecosystems

# Marine Ecosystems of Norway

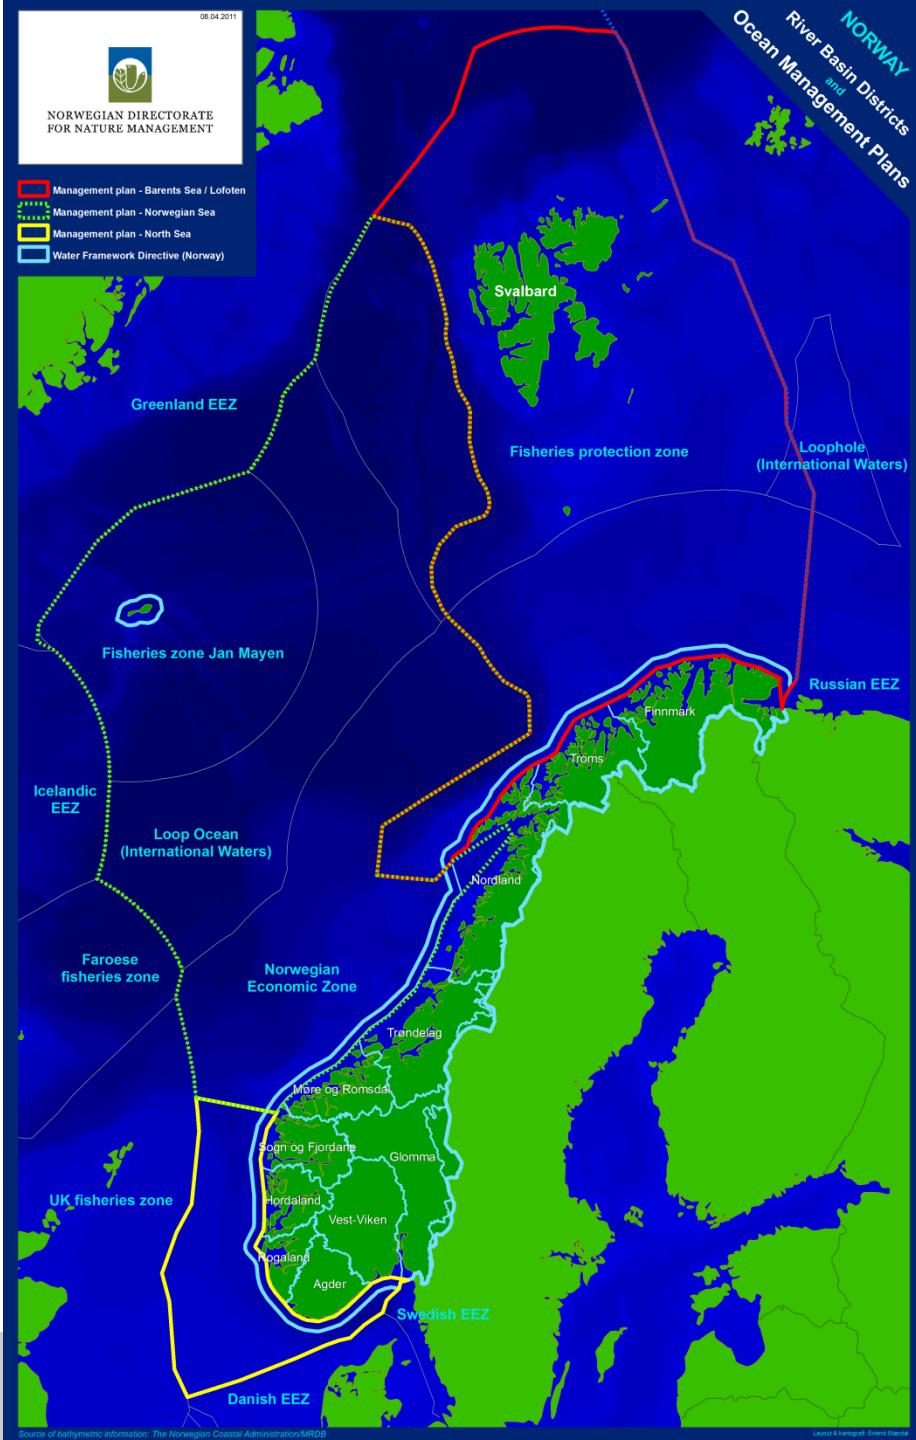

- Norwegian Seas: Jurisdiction over approx. 6 times the land area.
- Baseline: 2 500 km
- Coastline (mainland): 25 000 km
- Norwegian shoreline (mainland including islands): 83 000 km

## Management plans:

- ❖ Barents Sea: 961 000 km<sup>2</sup>, average depth 230 m
- ❖ Norwegian Sea: 1,17 million km<sup>2</sup>, average depth 1800 m and maximum 4000 m
- ❖ North Sea: about 142 000 km<sup>2</sup>, average depth 90 m

Norwegian Mapping Authority

# Economic significance of marine ecosystems and resources

- About 30 percent of national value creation (GDP)
- More than 10 percent of employment
- Well above 50 percent of the total Norwegian export

# Socio-economic aspects

- Value creation related to marine environment
- Employment (regional level)
- Social economics (national level)

# Barents Sea – environment

# Barents Sea - Fish stocks

- Almost all Norwegian catch of cod (93%) and haddock (85%) in Barents Sea – Lofoten
- Significant part even for herring (64%), prawns (57%) and saithe (50%)

# Barents Sea - Seabirds

- Barents Sea – Lofoten: 80% of seabirds on Norwegian mainland
- Røst and Gjesvær among biggest seabird colonies in Europe
- Population decline for several seabird species

Foto: Tycho Anker-Nilssen

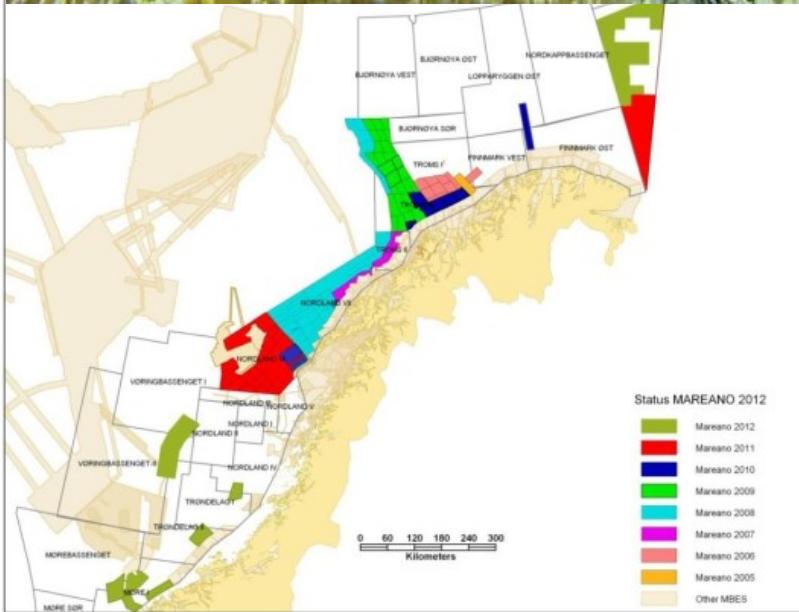

Foto: Norsk polarinstitutt

# Barents Sea - Seabed

- Røst coral reef, greatest known deepwater reef
- Coral reefs may have important function for fish and the ecosystem
- New species and habitats discovered

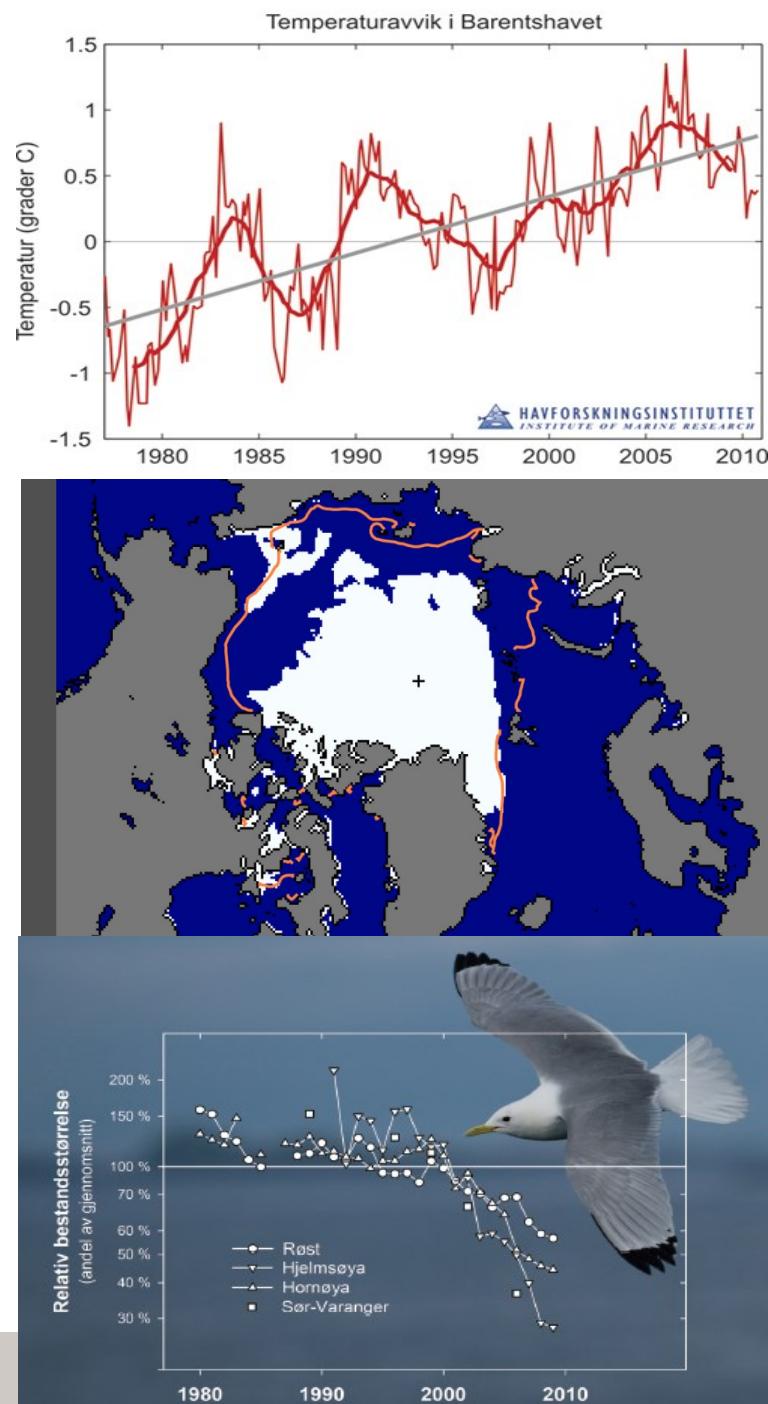

Source:  
MAREANO

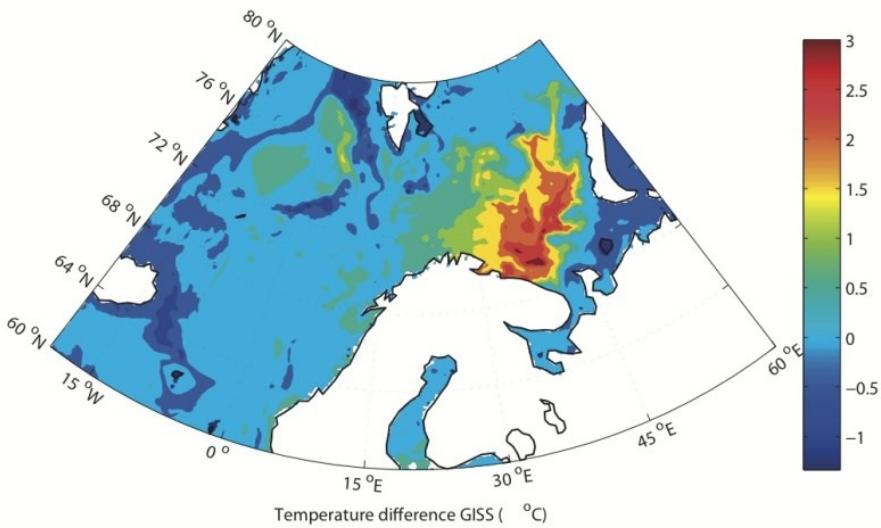

# Environmental status – Barents Sea

Overall environmental condition is good, and major commercial fish stocks are in good condition. But:

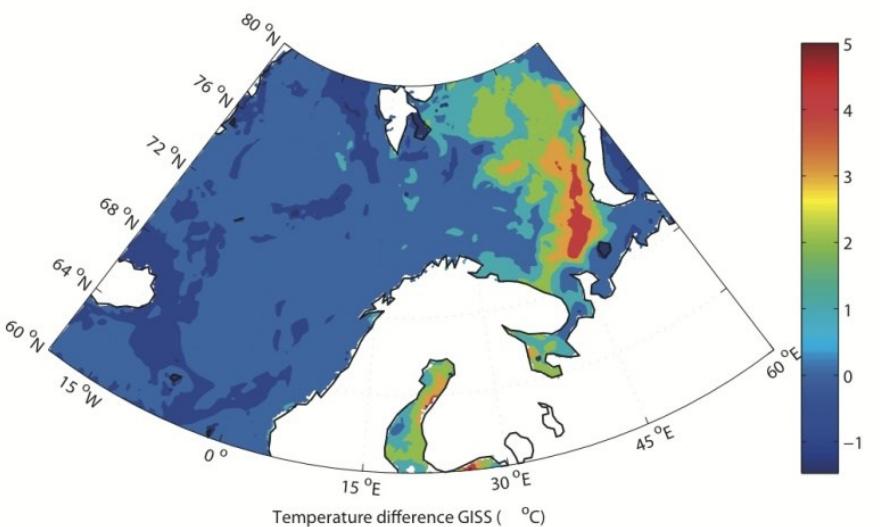

- Increasing water temperatures and acidity
- Sea ice in sharp decline
- Low pollution levels in general, but high in some top predators (polar bears, gulls)
- Negative trends for ice-dependent seals and some fish-stocks
- Most seabird populations in decline, some dramatically reduced

# Climate change and ocean acidification

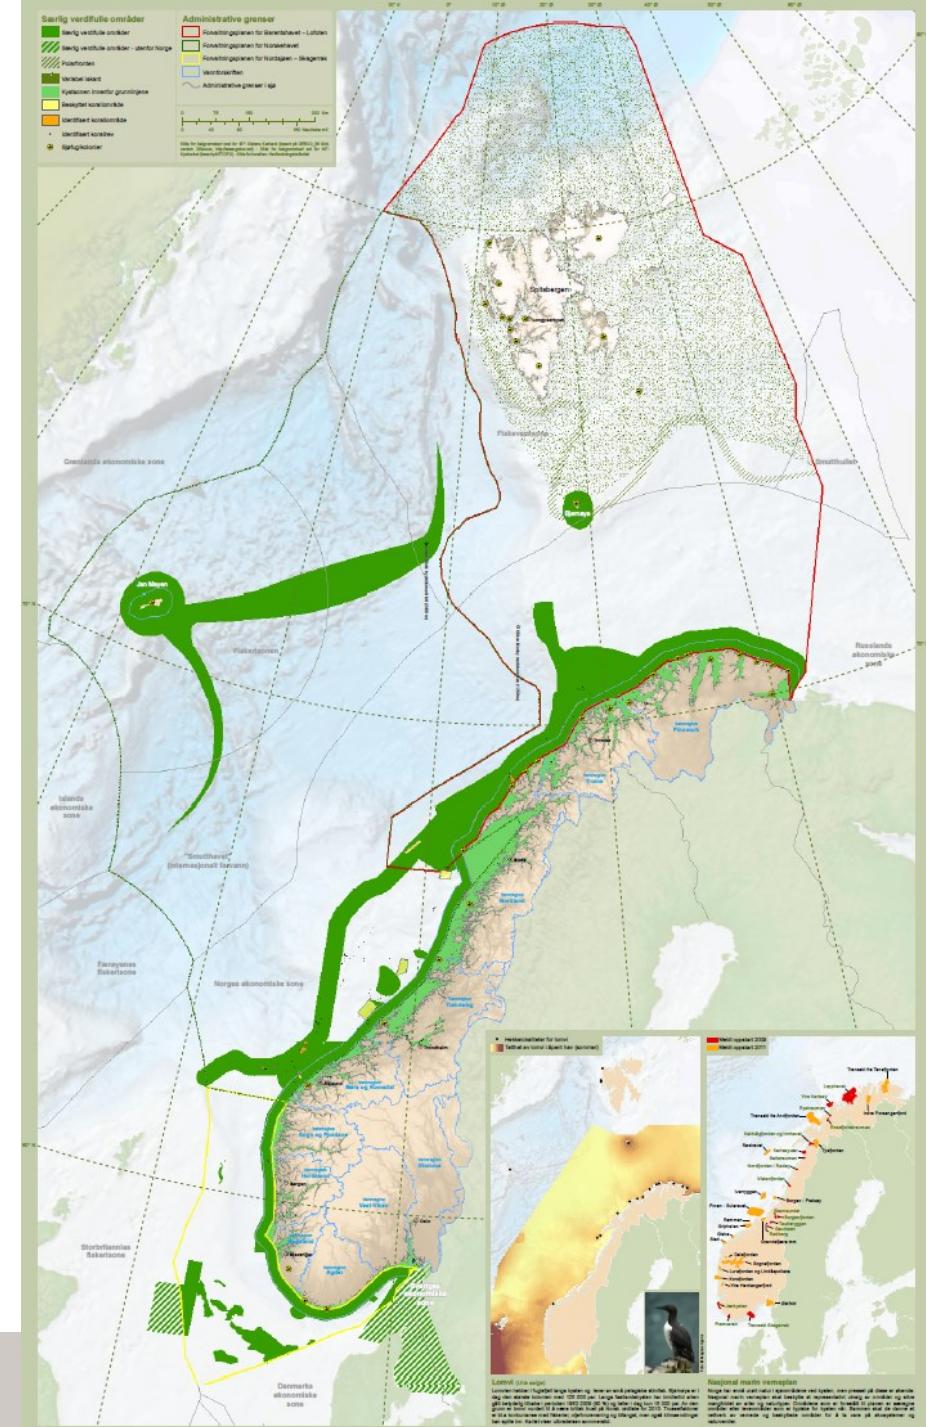

Damage to marine  
ecosystems expected  
in the following decades

# Biological diversity and production

Especially valuable and vulnerable areas in Norwegian waters

# Management plan – organisation & process

# White Papers 2002 - 2013

## Report No. 12 to the Storting

(2001–2002)

Protecting the Riches of the Seas

## Report No. 8 to the Storting

(2005–2006)

Integrated Management of the Marine Environment of the Barents Sea and the Sea Areas off the Lofoten Islands

Translation in English. For information only.

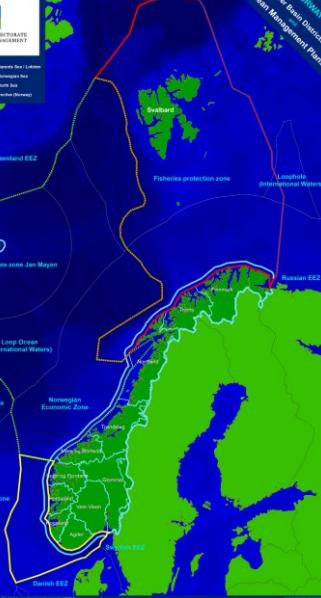

## Report No. 37 (2008–2009) to the Storting

Integrated Management of the Marine Environment of the Norwegian Sea

## Meld.St. 10 (2010–2011) Report to the Storting (white paper)

First update of the Integrated Management Plan for the Marine Environment of the Barents Sea-Lofoten Area

## Meld. St. 37

(2012–2013)

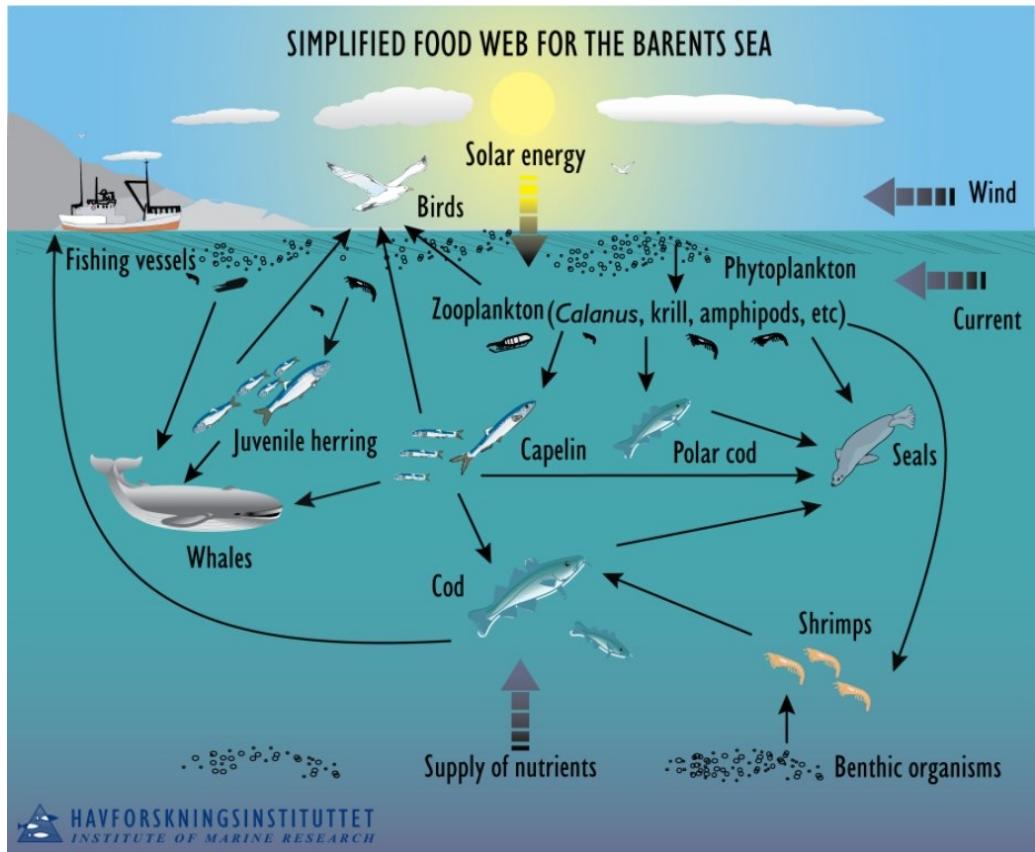

Melding til Stortet

Helhetlig forvaltning av det marine miljø i Nordsjøen og Skagerrak (forvaltningsplan)

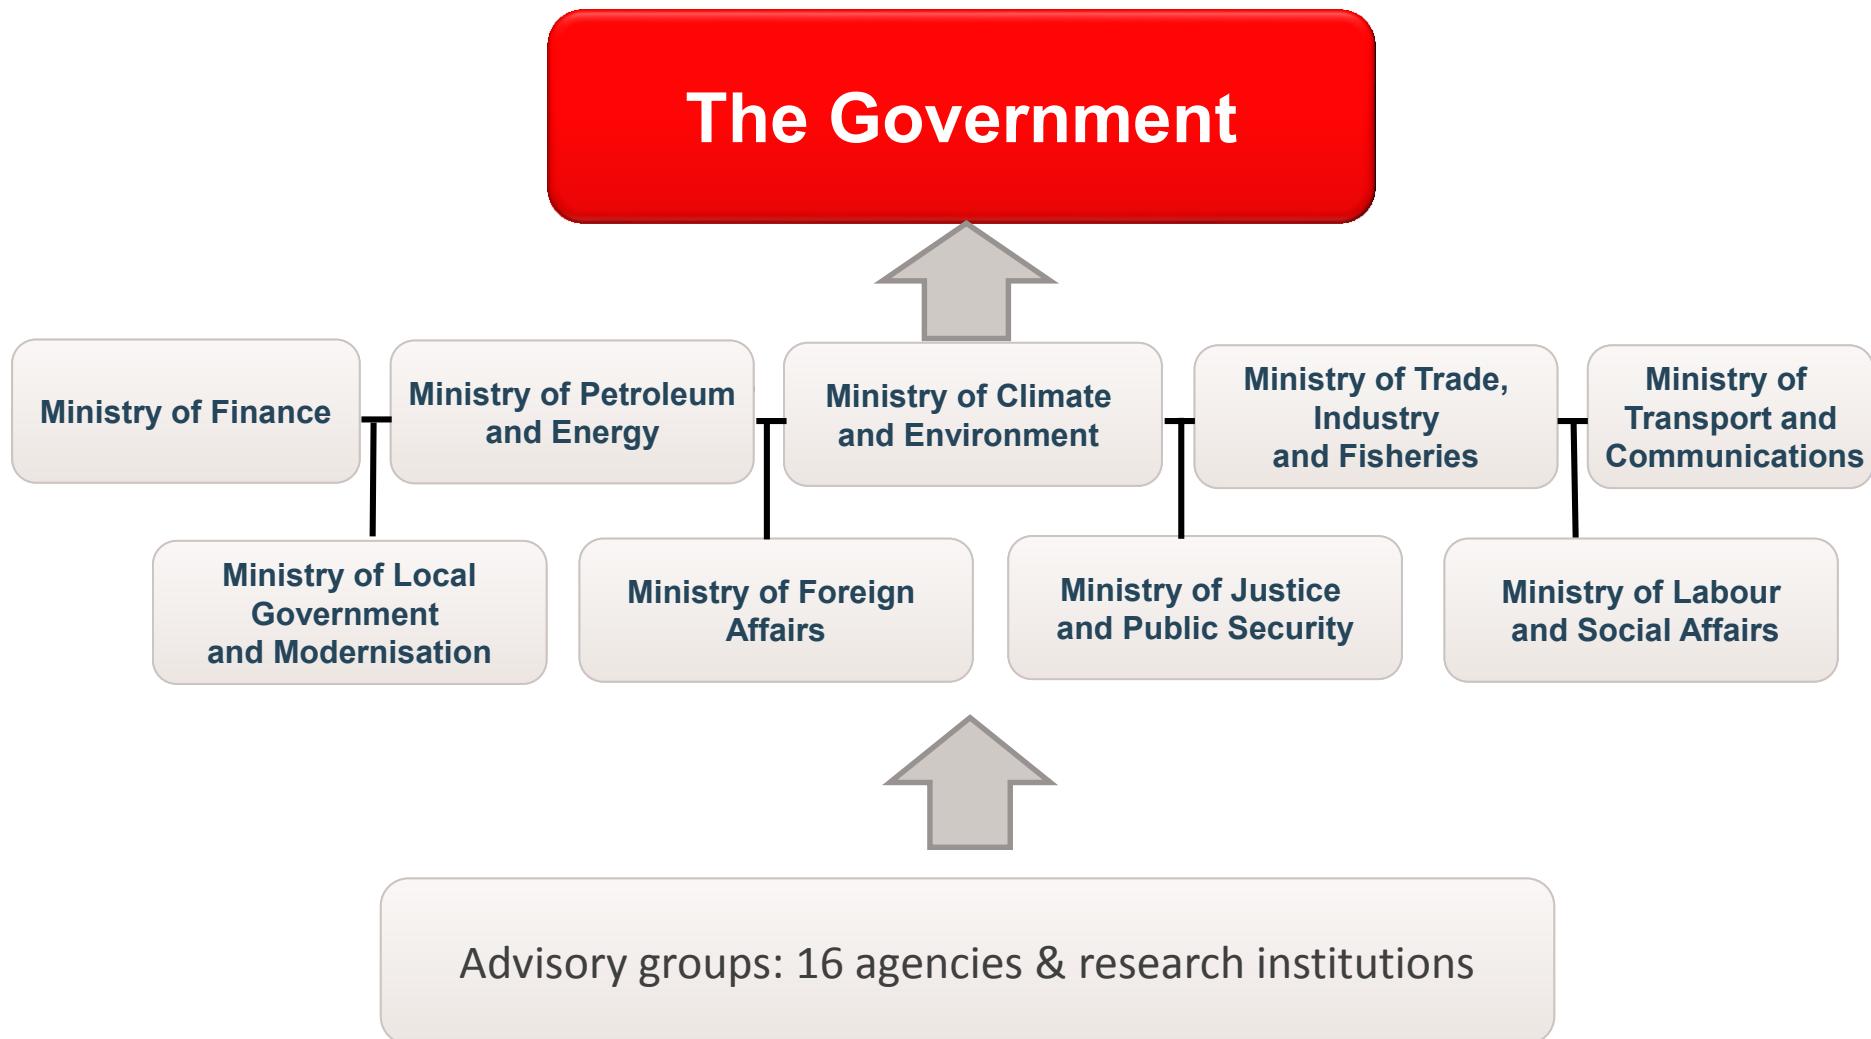

# Integrated Management Plans – Ecosystem Approach

The purpose of the management plans is to provide a framework for value creation through the sustainable use of natural resources and ecosystem services in the sea areas and at the same time maintain the structure, functioning, productivity and diversity of the ecosystems of the areas.

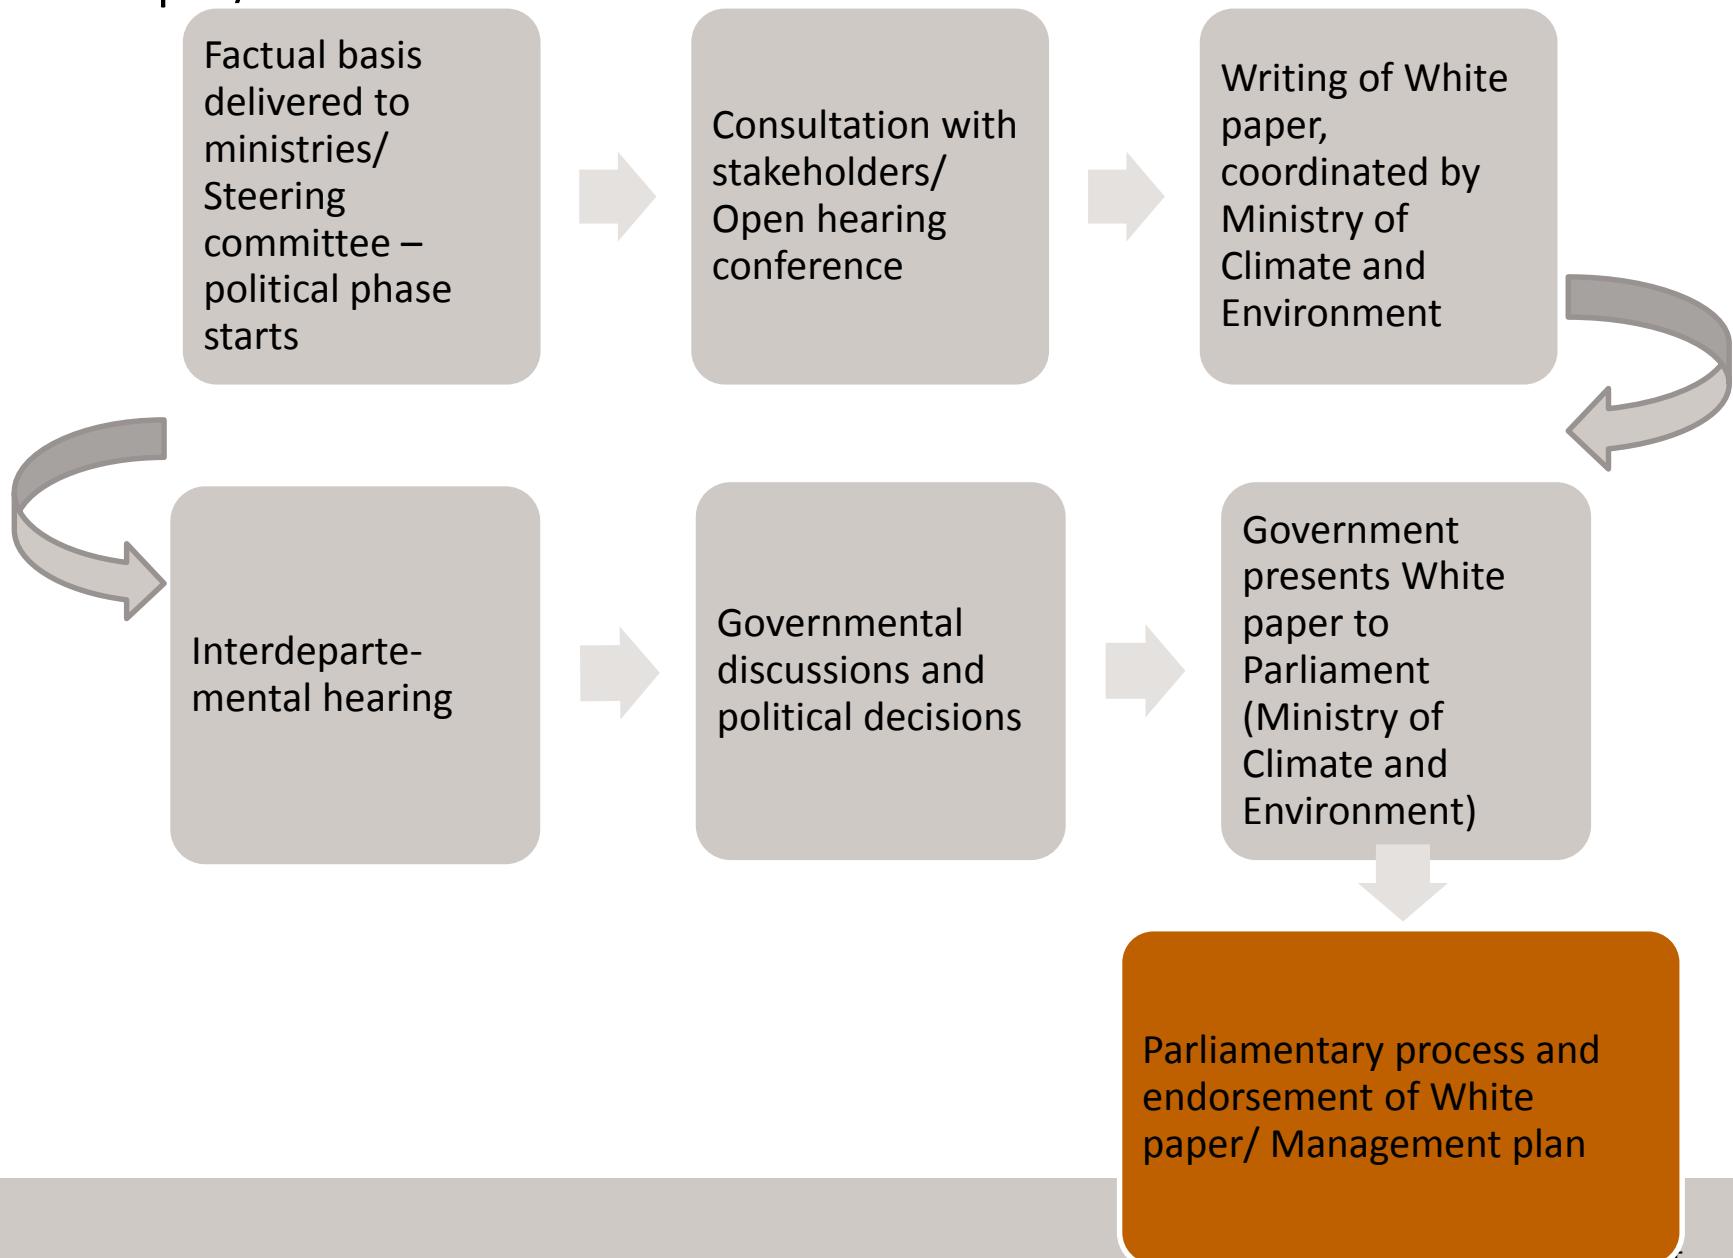

# Norwegian marine management plans - Organization

# Political phase – process for management plans

(White Paper)

# Follow-up

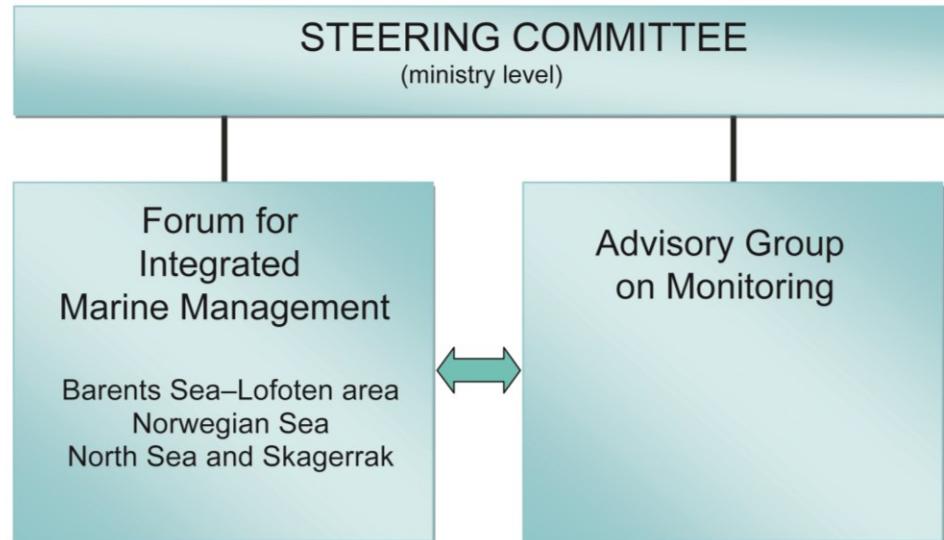

## Sectoral

Existing sectoral legislation

Management plan: Framework for authorities' work with licencing, permits for activities etc.

- *Ocean Resource Act* (Ecosystem Approach to Fisheries)
- *Pollution Control Act*
- *Nature Diversity Act*
- *Petroleum Act*
- *Harbour and Fairway Act*

## Cross-sectoral

# Shared knowledge

# Particularly valuable and vulnerable areas (green)

- important for productivity & biodiversity of entire ecosystem
- require special attention

## Geological mapping

Figur 4.8.2.5  
Utvilking i hekkbestanden av krykkje (tilsynelatende økkjupete reir) på Rost (Vedøy), Hjelmsey, Hornøy og Sor-Varanger (til venstre) og i noen kolonier på Svalbard (til høyre), vist som bestand i prosent av gjennomsnitt for alle år den er overvåket. For en mer detaljert kartforklaring, se Figur 4.8.2.1. For forklaring av y-aksebenemning, se figur 4.8.2.2.

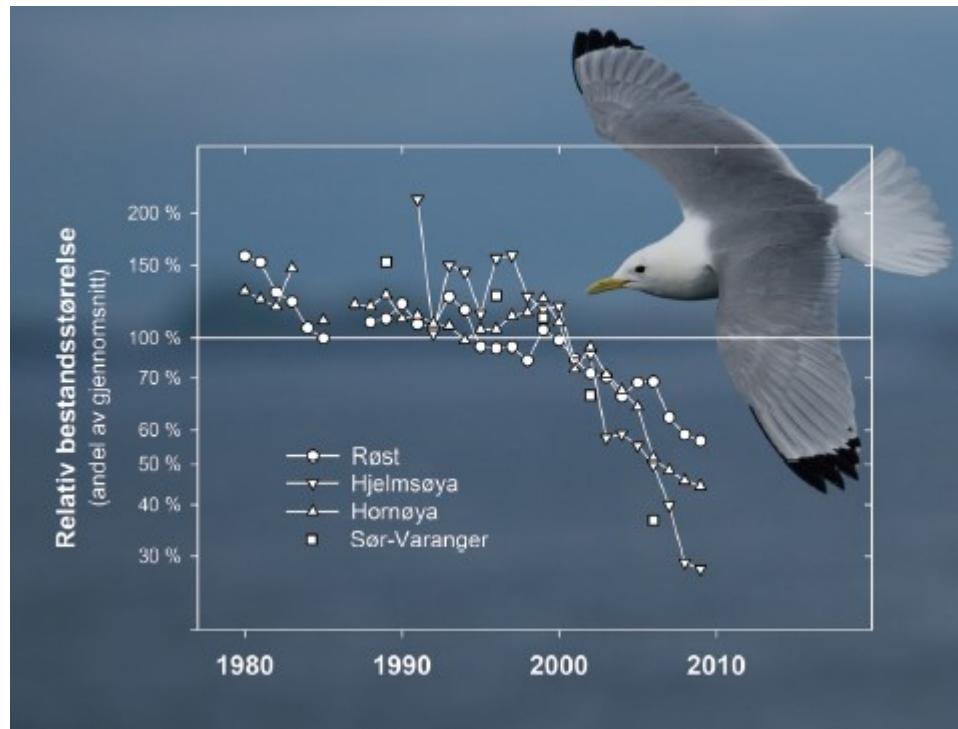

## Environmental monitoring & research

## Screening of hazardous chemicals

# Monitoring system for environmental quality

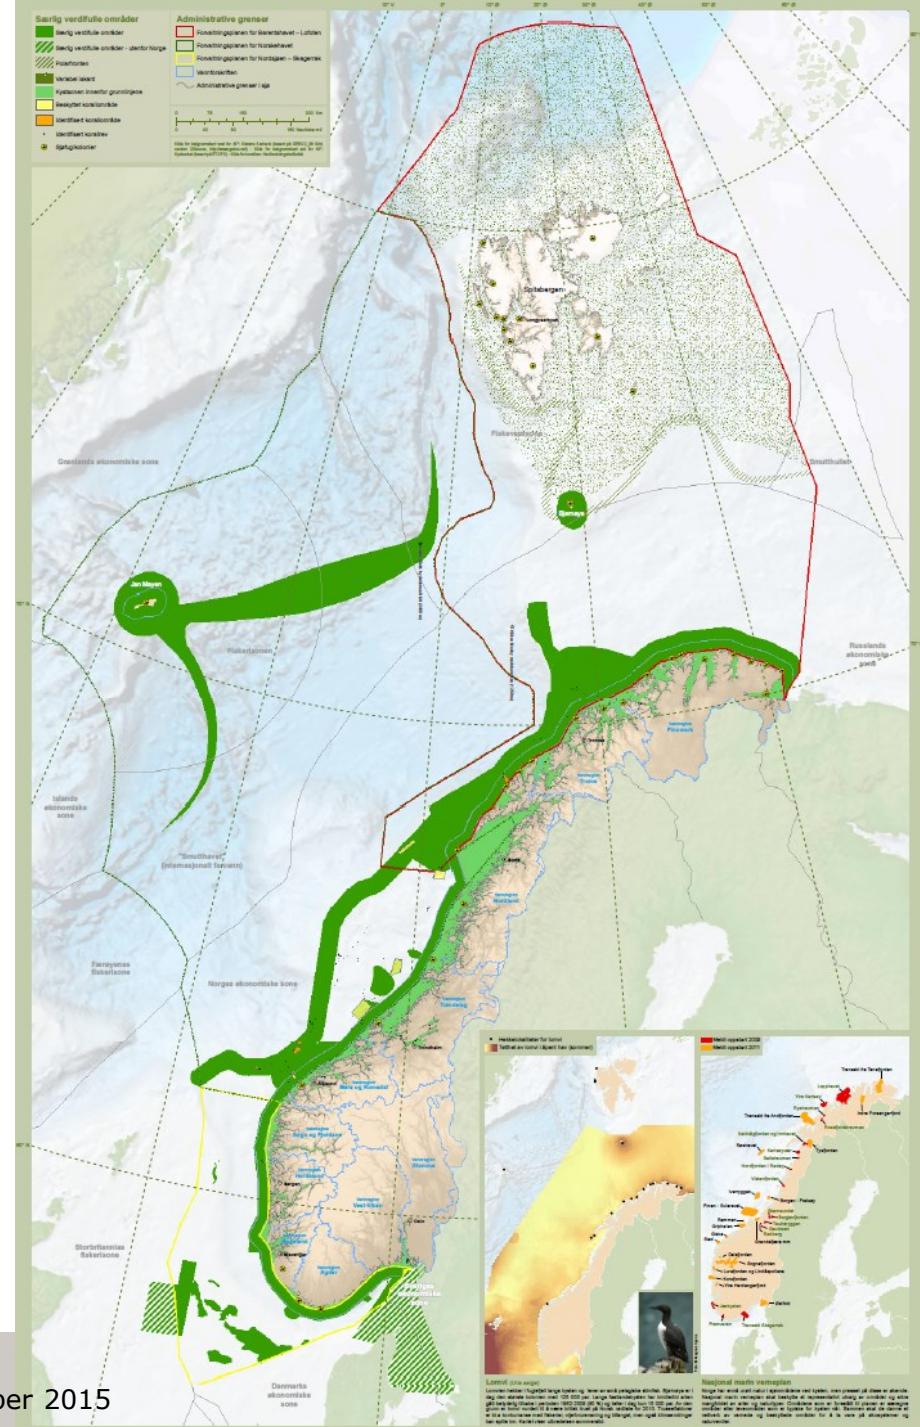

Indicator (34 different indicators)	Reference value	Action threshold
<b>Example Seabirds</b>		
Population trend for kittiwake ( <i>Rissa tridactyla</i> )	Average for last 10 years + historical data	Population decrease of 20 % or more in 5 years, or deviation of more than 10 % from expected adult survival rate, or failed breeding 5 years in a row

# Conclusion

# Summary: Integrated Marine Management Plans provides:

- A tool to cope with change and limit cumulative impacts through adaptive management of local activities
- A tool to resolve conflict of interests between activities in a way that safeguards the environment
- A system for early detection of negative impacts and implementation of mitigation measures
- A system to consider and implement conservation measures before new areas are opened up for activity
- A predictable framework for economic activities.

Thank you for
